

## Tridium Security Update

July 13, 2012

Following on the Tech Tip we published on July 3, we have posted a security alert regarding our Niagara AX Framework software about a vulnerability that could affect systems not properly configured.

The security alert outlines how to verify a system is properly configured to protect against directory traversal. We strongly urge you to review the security alert, assess the status of the system configuration and take the prescribed steps to secure it if necessary.

In addition, Tridium will soon be providing a software update that hardens the security settings of the system against inadvertent user changes. We will keep you informed of the timing of that release.

Tridium understands the importance of security and is committed to helping you make any necessary adjustments to the Niagara AX Framework software to ensure the highest security. Please contact [salesupport@tridium.com](mailto:salesupport@tridium.com) for any questions or concerns you have.
